Healthy Sunday Topic: Diabetes and Organ Donation

It is estimated that diabetes affects 25.8 million people in the United States and is one of the leading causes of death in Durham County. There are multiple complications of diabetes including kidney damage and sometimes kidney failure. In fact, diabetes is the leading cause of kidney failure in the United States and accounted for almost half of all new cases of kidney failure in 2008.

Dr. Bryan Batch

According to Dr. Bryan Batch, an assistant professor in endocrinology, metabolism, and nutrition at Duke, “good control of blood sugar and blood pressure has been shown to decrease the risk of developing kidney disease related to diabetes. For individuals that already have kidney disease, controlling blood sugar and blood pressure can reduce the risk of worsening kidney disease.”

There are some individuals who will develop end stage kidney disease because of damage to the kidneys from diabetes. Once individuals develop kidney failure they require dialysis or a kidney transplant to survive. In 2008 it was estimated that a total of 202, 290 people with end stage kidney disease secondary to diabetes were on chronic dialysis or living with a transplant.

Organ and Tissue Donation

The need for transplants is very high among ethnic minorities- especially African-Americans and Hispanics. The rate of organ donation in minority communities does not keep pace with the number needing transplants.

African-Americans make up about 22% of North Carolina's overall population but make up 52% of North Carolinians waiting for an organ transplant. Minority patients may have a longer wait for matched kidneys to become available therefore may be sicker at the time of transplant or die waiting.

**RECYCLE
YOURSELF
BECOME AN
ORGAN DONOR**

REMEMBER

Always exercise regularly, **B**ecome an organ donor, **C**ontrol and monitor your blood glucose and blood pressure

GIVE LIFE. Become an Organ Donor
